smoothglo

SmoothGlo is a nonsurgical treatment that rejuvenates the skin by improving its texture, tone, and volume. It also reduces excess pigmentation, laxity, acne scars, fine lines and wrinkles. While it's usually done on the face, Lumenis SmoothGlo can also be performed on the neck, chest, arms, the back of hands, and elsewhere on the body.

What's unique about SmoothGlo is how it combines IPL and microneedling to turn back the clock. If you've been looking for a way to combat various age-related issues through one procedure, and you don't mind a short recovery period, you could be a good candidate for this innovative treatment. The IPL improves tone, removes lesions and increases the skin's water content; the RF microneedling introduces an electrical charge to benefit texture and volume with little to no downtime.

More on IPL and RF MicroNeedling...

IPL: An intense pulsed light (IPL) treatment with the Stellar M22, a versatile procedure that can treat more than 30 common skin concerns, including rosacea, broken capillaries, hyperpigmentation, and photodamage. An IPL laser treatment (aka photofacial) uses broadband light to target brown and red pigment in the skin. It also stimulates new collagen production, to help firm skin and smooth fine lines and wrinkles.

MicroNeedling: VoluDerm radiofrequency (RF) microneedling from the Legend Pro platform, in which tiny needles penetrate the skin's surface to deliver RF energy into the dermis. This stimulates a healing response that ramps up new collagen production. Clinical studies conducted by Lumenis showed that this also results in three times as much naturally occurring hyaluronic acid - a sugar molecule in the skin that binds water to collagen - for skin that's more hydrated and plump.
